³ Ideally these should be established at high density, with one plant per square metre, however this would require 10,000 seedlings per hectare which is usually cost prohibitive

⁴ Grows in saline sites

⁵ Would usually colonise sites, only plant if required in short term for erosion control

⁶ Ideally these should be established at high density, with one plant per square metre, however this would require 10,000 seedlings per hectare which is usually cost prohibitive; grasses can be established by machine direct seeding but this requires specialist machinery, hand broadcasting is a cheaper alternative.
